From a maze at 4 to a spiral at 10

Coding, logic and maths with no screen

[photo, large: assets/photos/01-spirale-tracee.jpg]

The robot drew this spiral itself, following its own program.

One robot grows with the child from age 4 to 10 and beyond. Younger children pick up logic and work through mazes, older ones move on to angles, geometry and drawing.

Draws real geometry with a marker

Slip in a marker and the robot will draw a spiral or a complex shape on paper, working out the angles and distances as it goes. A plain rolling robot with no screen cannot match that precision. The child sees the result of their program right there on the page.

One robot instead of several purchases

Coding, drawing, geometry, voice and a ready-made teaching method come in the base kit. Where you would normally keep several robots for different ages or buy paid add-on packs for one, here a single robot covers it all. There is nothing to pay extra for.

Works with what you already have

The robot drives on any squared maps and mats: ready-made ones, or ones you print or draw yourself. There is nothing branded to buy. The step adjusts to any cell size, 15 cm by default.

[photo: assets/photos/02-robot-sur-quadrillage.jpg, robot on the grid]

Lesson plans and activities already included

A ready-made course leads from the first program through functions, loops, distances and angles to arithmetic. For younger children aged 4-8 there is a separate introductory course of 12 lessons. Everything is open in the documentation, so you can look before you order. One kit for a group of 2-4 children: the robot, a wooden control

panel and cardboard command tiles. Children build the program by hand right on the panel.

The child finds the mistake themselves

The program stays on the panel, right in front of the child. If the robot heads the wrong way or the line comes out crooked, the child finds the wrong step, changes part of the program and tries again. With a marker it is even clearer: the mistake shows up at once on the paper.

Letters, words and music

The robot speaks every step and every command aloud, in the language you choose. Voice output is available in more than 17 languages. It rolls onto a card with a word and says it out loud. Around 90 words in all: house, forest, cinema. It names the letters of the alphabet, plays notes and reads out arithmetic. The same robot that teaches coding and counting also introduces speech and music along the way.

From 4 to 10+, one robot

4-7 years (early primary school): movements and turns, mazes, sequences, loops.

7-10 years (upper primary school): precise distances and angles, arithmetic, geometry of shapes, drawing with a marker.

10+: the same robot is programmed from Scratch.

Already in use

Terra Numerica, a French science outreach centre (Sophia Antipolis; a project of CNRS, Inria and Université Côte d'Azur), already uses PrimaSTEM in its sessions.

No screen. Made in France (Cannes), CE and UKCA certified.

The price is set by the distributor.

Try the robot before you buy. It runs right in your browser. Open the link or point your camera at the QR code:

Small print, at the bottom:

Contents. Control panel, robot and a set of cardboard command tiles (NFC). One kit is designed for a group of 2-4 children. A USB-C cable and charger are not included; any

standard ones will work.

Specifications. The robot and control panel are wooden, the tiles are cardboard. Robot 125 mm in diameter, 44 mm tall, 220 g. Control panel 317 x 217 x 62 mm, 680 g. Tiles 33 x 33 mm, NFC. 11 double slots. Step 15 cm by default, adjustable to any size. Turns from 1 to 360 degrees. Bluetooth around 5 m. Li-Ion battery, USB-C charging, about 1.5 hours. Age 4-10 years. Made in Cannes, France. CE and UKCA certified.

Service. Standard markers work, the battery is replaceable. Warranty and service are provided by the distributor.

The reference number and price are set by the distributor.
